The Organic Chemistry of Museum Objects provides an account of the composition, chemistry, and analysis of the organic materials which enter into the structures of objects in museum collections. This book is not intended to duplicate the information available in existing handbooks on the materials and techniques of art and conservation but rather to convey the state of knowledge of the chemical composition of such materials and so provide a framework for a general understanding of their properties. The book begins with a review of basic organic chemistry, covering hydrocarbons and compounds with functional groups. It then describes spectrometry and separation methods. This is followed by discussions of the chemistry and composition of oils and fats, natural waxes, bituminous materials, carbohydrates, proteins, and natural resins and lacquers. Subsequent chapters deal with synthetic materials, i.e., high molecular weight polymers of a wholly synthetic nature; and natural and synthetic dyestuffs. Also discussed are the deterioration and other changes in organic materials resulting from both free radical and ionic reactions; and the application of analytical methods to identify the organic materials of actual museum objects. This book is intended for both chemists and nonchemists.

Part I: Process design -- Introduction to design -- Process flowsheet development -- Utilities and energy efficient design -- Process simulation -- Instrumentation and process control -- Materials of construction -- Capital cost estimating -- Estimating revenues and production costs -- Economic evaluation of projects -- Safety and loss prevention -- General site considerations -- Optimization in design -- Part II: Plant design -- Equipment selection, specification and design -- Design of pressure vessels -- Design of reactors and mixers -- Separation of fluids --

Separation columns (distillation, absorption and extraction) -- Specification and design of solids-handling equipment -- Heat transfer equipment -- Transport and storage of fluids.

'The Organic Chemistry of Museum Objects' makes available in a single volume, a survey of the chemical composition, properties and analysis of the whole range of organic materials incorporated into objects and artworks found in museum collections. The authors cover the fundamental chemistry of the bulk materials such as wood, paper, natural fibres and skin products, as well as that of the relatively minor components incorporated as paint, media, varnishes, adhesives and dyes. This expanded second edition, now in paperback, follows the structure of the first, though it has been extensively updated. In addition to chapters on basic organic chemistry, analytical methods, analytical findings and fundamental aspects of deterioration, the subject matter is grouped as far as possible by broad chemical class - oils and fats, waxes, bitumens, carbohydrates, proteins, natural resins, dyestuffs and synthetic polymers. This is an essential purchase for all practising and student conservators, restorers, museum scientists, curators and organic chemists.

The exciting new Heinemann Chemistry Enhanced series has been developed to support the 2007-2012 Chemistry Study Design. Key features: Chapter opener includes key knowledge statements and outcomes Each chapter is divided into clear-cut sections which finish with a set of summary points and key questions Chapter review questions are found at the end of each chapter Chemistry in Action boxes contain Chemistry in an applied situation of relevant context ChemCAL boxes flag the ChemCAL website which is found on Exam Cafe Online. Extension boxes contain material which goes beyond the core content of the study design The Area of Study Review includes a large range of exam-style questions both multiple choice and extended response The 'Cutting Edge' spreads are written by practising Australian scientists and have been updated to the most modern Chemistry to life while addressing this vital area of the study design Chemfacts are snippets of information that add interest and relevance to the text The glossary at the end of the book can be used to check the meaning of important words A comprehensive index is included and appendices include important support material.

The second edition was first published in hardcover in 1990, and this is the first appearance of a paperback. This edition contains a new chapter on slag and more questions and their solutions for students. Other subjects include chemical bonds, a study of the periodic table, metallurgical thermodynamics, reaction kinetics, liquid metal solutions, aqueous metal solutions and electrochemistry, metal extraction processes, melting and recycling, and corrosion.
