In subsea production system design, a whole-system modeling approach is used to define the hardware requirements and operating strategies (Kaczmarek and Lorimer, 2001; Arciero, 2017; Bomba et al., 2018). To optimize the system design, software models for each component are used to understand the trade-offs that result from balancing steady-state and transient operations with flow assurance management:

A subsea production system provides a way to produce hydrocarbons from areas not economically or easily developed by the use of an offshore platform. The system makes use of a number of building blocks placed on the seabed which are connected to subsea pipeline networks and riser systems to safely and efficiently produce the reservoir to a host facility.

CHAPTER 1 INTRODUCTION The rapidly accelerating shift to subsea production systems represents a significant departure from conventional operations. Historically, subsea wells have had a good track record. However, complex subsea systems are now being deployed in ways rarely encountered in previous development schemes.

**AN ASSESSMENT OF SUBSEA PRODUCTION SYSTEMS**

Subsea production systems range in complexity from a single satellite well with a flow line linked to a fixed platform with floating production storage and off-loading (FPSO) or an onshore installation to several wells on a template or clustered around a manifold and transferring to a fixed or floating facility or directly to an onshore installation.
