when moving between two substances.

Mirrors work by reflection, by the bounding of light off of a shiny surface. Images in mirrors always look twice as far away as the object.

Remember that concave mirrors have positive focal lengths, and convex mirrors have negative focal lengths. You calculated a positive focal length in Part A, so the mirror must be concave. Part C What is the magnitude of the radius of curvature of this mirror? Express your answer in meters, as a fraction or to three significant figures. Hint

The purpose of this part is to study images made by lenses and to verify the imaging laws for lenses. The imaging law for the lenses relates the distance from the object (o) [NOTE: KJF2 calls this s] and the image (i) [NOTE: KJF2 calls this s'] from the lens to the focal length (f) of the lens. This relationship is given in KJF2, Ch. 18.7.
