India is a country of great diversity. Commonly used indicators of 'quality of life' vary tremendously between states. Comparing experiences within India itself, these essays challenge purely economic judgements of the development process.

Nontimber forest products (NTFPs) are fundamental to the functioning of healthy forests and play vital roles in the cultures and economies of the people of the United States. However, these plants and fungi used for food, medicine, and other purposes have not been fully incorporated into management, policy, and resource valuation. This report is a forest-sectorwide assessment of the state of the knowledge regarding NTFPs science and management information for U.S. forests and rangelands (and hereafter referred to as the NTFP assessment). The NTFP assessment serves as a baseline science synthesis and provides information for managing nontimber forest resources in the United States. In addition, this NTFP assessment provides information for national-level reporting on natural capital and the ecosystem services NTFPs provide. The report also provides technical input to the 2017 National Climate Assessment (NCA) under development by the U.S. Global Change Research Program (USGCRP).

This study is one in a series of activities undertaken by CIFOR to reach a better understanding of the impact of commercialisation on forest resources and what factors influence the market demand for forest products. For example, two international workshops were organized by CIFOR in 1995 and another the following year to analyse key research issues in the field of NTFP development. These workshops recognised that the process of NTFP commercialisation interacts with people's welfare, forest management, tenure and control of resources, and forest structure and function (through ecological processes). Earlier review and analysis had generated a number of hypotheses, theories and conclusions related to the effects of commercialisation. Forest and resource tenure are likely to both affect the way a resource is managed and utilised, and be affected by changes in value due to commercialisation. Many authors have suggested that NTFP harvesting will be less damaging to biodiversity and other environmental values than management for timber. Others suggest that market pressures are likely to lead to the decline and eventual disappearance of valuable products and to severe impacts on the ecosystem. While there is a growing understanding (and acceptance) of the economic importance of forest products, especially for the poor, the potential impact of NTFP commercialisation needs to be better understood. A recommendation from the workshops was to undertake a thorough overview of the available literature to synthesise the key lessons about these areas of interaction. Such a review would critically examine the available information and analyses and identify key research areas needing further attention.

The Fearfully High Costs Of Elections And The Role Of 3 M.P.S Money Power, Muscle Power And Mafia Power And Of 4 Cs Communalism, Casteism, Criminalisation, And Corruption Have Polluted The Functioning Of Our Political Parties And Electoral Processes. The

In the first comprehensive exploration of the history and practice of folk medicine in the Appalachian region, Anthony Cavender melds folklore, medical anthropology, and Appalachian history and draws extensively on oral histories and archival sources from the nineteenth century to the present. He provides a complete tour of ailments and folk treatments organized by body systems, as well as information on medicinal plants, patent medicines, and magico-religious beliefs and practices. He investigates folk healers and their methods, profiling three living practitioners: an herbalist, a faith healer, and a Native American healer. The book also includes an appendix of botanicals and a glossary of folk medical terms. Demonstrating the ongoing interplay between mainstream scientific medicine and folk medicine, Cavender challenges the conventional view of southern Appalachia as an exceptional region isolated from outside contact. His thorough and accessible study reveals how Appalachian folk medicine encompasses such diverse and important influences as European and Native American culture and America's changing medical and health-care environment. In doing so, he offers a compelling representation of the cultural history of the region as seen through its health practices.

"In the late twentieth century, residents of the Blue Ridge mountains in western North Carolina fiercely resisted certain environmental efforts, even while launching aggressive initiatives of their own. Kathryn Newfont provides context for those events by examining the environmental history of this region over the course of three hundred years, identifying what she calls commons environmentalism—a cultural strain of conservation in American history that has gone largely unexplored. Efforts in the 1970s to expand federal wilderness areas in the Pisgah and Nantahala national forests generated strong opposition. For many mountain residents the idea of unspoiled wilderness seemed economically unsound, historically dishonest, and elitist. Newfont shows that local people's sense of commons environmentalism required access to the forests that they viewed as semipublic places for hunting, fishing, and working. Policies that removed large tracts from use were perceived as 'enclosure' and resisted. Incorporating deep archival work and years of interviews and conversations with Appalachian residents, Blue Ridge Commons reveals a tradition of people building robust forest protection movements on their own terms."-p. [4] of cover.

It was in late 2002 that the idea of preparing a collection of multi-authored chapters on different aspects of ag- st forestry as a compendium for the 1 World Congress of Agroforestry, June 2004, was tossed around. With the approval of the idea by the Congress Organizing Committee, serious efforts to make it a reality got under way in early 2003. The rigorously peer-reviewed and edited manuscripts were submitted to the publisher in December 2003. Considering the many different individuals involved in the task as authors and manuscript reviewers, we feel quite pleased that the task could be accomplished within this timeframe. We are pleased also about the contents on several counts. First of all, the tropical-temperate mix of topics is a rare feature of a publication of this nature. In spite of the scienti?c commonalities between tropical and temperate practices of agroforestry, the differences between them are so enormous that it is often impossible to mesh them together in one publication. Secondly, several of the chapters are on topics that have not been discussed or described much in agroforestry literature. A third feature is that some of the authors, though well known in their own disciplinary areas, are somewhat new to agroforestry; the perceptions and outlooks of these scholars who are relatively unin?uenced by the past happenings in agroforestry gives a whole new dimension to agroforestry and broadenthescopethe subject. Finally, ratherthanjustreviewingandsummarizingpastwork,mostchapterstake the extra effort in attempting to outline the next steps.

Focusing on the mountainous area from northern Alabama to West Virginia, this important volume explores the historic and contemporary interrelations between culture and environment in a region that has been plagued by land misuse and damaging stereotypes of its people. Committed to taking account of humankind's place in the environment, this collection is a timely contribution to debates over land use and conservation. Debunking the nature/culture dichotomy, contributors examine how physical space is transformed into culturally constituted "place" by a variety of factors, both tangible (architecture, landmarks, artifacts) and intangible (a sense of place, long-term family habitation of land, tradition, "a way of life worth fighting for"). Archaeologists, cultural geographers, and ethnographers examine how the land was used by its earliest inhabitants and trace the effects of agricultural decline, industrial development, and tourism in the nineteenth and twentieth centuries. Powerful case studies recount past displacement of local populations in the name of progress or conservation and track threatened communities' struggles to maintain their claims to place in the face of extralocal counterclaims that would appropriate space and resources for other purposes, such as mountaintop removal of coal or a power company's plans to export electricity from Appalachia to distant urban centers. Contributors also record successful community planning ventures that have achieved creative solutions to seemingly intransigent conflicts between demands for economic wealth and environmental health.
